

INTERMOBILITY FUTURE WAYS – THE FUTURE WAYS REPORT

The objective of the report

The objective of the Future Ways Report is to describe the state of play, trends and major drivers of change affecting the range of shared mobility solutions, in light of the innovation brought about by the green and digital transition. This transition has led to the emergence and consolidation of new mobility services, new needs, new organisational models and new criteria for combining and complementing the various types of services, modes and means of transport.

This transformation, which also affects mobility behaviour and styles, presents extremely promising scenarios for the three dimensions of sustainability: environmental and social benefits related to rebalancing modes of transport, reduction of personal car use in addition to improved accessibility to the regions, and growth of one of the key sectors of the green economy.

The scope of analysis

The scope of analysis of the Future Ways Report includes all shared mobility services (passenger/ground transport) but also all those solutions that promote the planning, use and integration of services, their decarbonisation and digitisation. Establishing a scope of investigation in which, at a single glance, all mobility services are included together as part of a single system implies a desire to look forward.

Although the sources used in the Future Ways Report will be those of existing national and other databases, the originality of the analysis lies in the fact that it charts the common horizon of transport and mobility sectors hitherto considered separate: local public transport, collective transport subject to competition such as railways and bus lines, non-scheduled public transport, divided in turn between taxis and car rental with driver, shared mobility and digital platforms with various features and functions.
